A little Pokemon data exploration

I explored 801 Pokemon from Generations 1-7 in Excel and built an interactive dashboard. Here are a few things that stood out.

What I found

- The recorded gender ratios lean slightly male, even though many Pokemon have a 50/50 split.
- Only 70 Pokemon (8.7%) are Legendary. They really are a small club.
- Generation 5 introduced the most Pokemon (156), while Generation 6 introduced the fewest (72).
- Water is the most common primary type, with 114 Pokemon.

What I want to explore next

This is just my first look at the dataset. I want to come back to explore Pokemon classifications, which types are most vulnerable or resistant to attacks, how experience growth differs, and what other patterns I can uncover.

Explored in Microsoft Excel | Generations 1-7 | 801 records analysed
